

CHAD PURNELL M.D.

CRANIOFACIAL AND PLASTIC SURGERY

Pre-and postoperative care instructions Tooth extractions (Including wisdom teeth)

Before the Operation:

- **Maintaining oral cleanliness before the operation is EXTREMELY important.** 2 weeks before the operation, you should brush your teeth at least 3 times every day and floss at least once a day.
- Follow the instructions given to you by our scheduler regarding eating and drinking. Try as much as possible to show up early. If you don't receive a call the day before surgery, call our hospital before 4:00 PM at 773-622-5400 to check on your instructions.

Hospital Stay: Usually, tooth extractions are an outpatient procedure and you can go home the same day.

After the Operation:

- Incision care:
 - o **For the incisions in the mouth, cleanliness is very important.** Use Peridex mouthwash twice a day for the first two weeks, then transition to regular mouthwash. After eating or drinking anything, you should swish with warm water to keep everything clean. You should brush their teeth at least 2 times a day with a soft bristle toothbrush starting the day of surgery. Make sure to look at your incisions and if there is food stuck near them, gently clean it out with a soft toothbrush or waterpic. The stitches are dissolvable and will go away on their own.
- Pain Control: For the first 1-2 days, it is usually easier to **schedule** non-opioid pain medications rather than waiting to see if you needs them. No need to wake up to take the medication, just take the next dose when you wake up.
 - o You can take acetaminophen every 6 hours and ibuprofen (Motrin) every 6 hours, so you will get a medication every 3 hours. If this is not relieving the pain, you may add a dose of oxycodone.
 - o The vast majority of patients only require opioid medication for the first day after tooth extraction and most never need any. **Opioid medications can result in you being more sleepy, nausea, and can cause constipation.** They should only be given if necessary.
- Other Medications: You will use the Peridex mouthwash for 2 weeks postoperatively.
- Diet: You will drink liquids for the first night after the operation, and then can transition to a soft diet. A soft diet includes anything you can squish with your

fingers, such as scrambled eggs, noodles, smoothies, and milkshakes. NO CRUNCHY FOOD or food that is difficult to chew for 4 weeks.

- Activity: No contact sports for 4 weeks after surgery.
- Bathing: You may shower normally with soap and water. This can be done as early as the day after the operation.
- Follow-up appointments: Patients are typically seen 2-4 weeks after tooth extractions. You may be able to follow up with your dentist or orthodontist if you are from far away.

Things to let us know about:

- **Call the Office if:**
- You develop a temperature of **over 101 degrees** Fahrenheit (38.3 degrees Celsius) – it is not necessary to check temperatures after surgery unless you feel like something is wrong.
- Your child has **increasing redness, pain, weeping fluid, or swelling** at their surgical site. Swelling is normal for the first few days after surgery, but if swelling returns we would like to know.
- If you have **severe pain that is not controlled by pain medication**.
- **If you have any concerns or questions**, contact us. We are used to receiving questions from parents and can help you decide if something is normal or abnormal after surgery.
